2016

2017

# GCOS Essential Climate Variables – ECVs

- grouped by measurement domain and area covered.

The groups show how observations across all the measurement domains are needed to capture specific phenomena or issues.

|                                | Atmosphere   | Terrestrial   | Ocean  |
|--------------------------------|--|---|--|
| Energy & Temperature           | Surface Radiation Budget, Earth Radiation Budget, Surface Temperature, Upper Air Temperature, Surface and Upper Air Wind Speed | Albedo, <i>Latent and Sensible Heat</i> fluxes, Land Surface Temperature                                  | Ocean Surface Heat Flux, Sea Surface Temperature, Subsurface Temperature                 |
| Other Physical Properties      | Surface Wind, Upper Air Wind, Pressure, Lightning, Aerosol Properties  |   | Surface Currents, Subsurface Currents, Ocean Surface Stress, Sea State, Transient Traces |
| Carbon Cycle and other GHGs    | Carbon Dioxide, Methane, Other long-lived GHG, Ozone, Precursors for Aerosol and Ozone   | Soil Carbon, Above-ground Biomass   | Inorganic Carbon, Nitrous Oxide  |
| Hydrosphere                    | Precipitation, Cloud Properties, Water Vapour (Surface), Water Vapour (Upper Air), Surface Temperature,                        | Soil Moisture, River Discharge, Lakes, Groundwater,   | Sea Surface Salinity, Subsurface Salinity, Sea Level, Sea Surface Temperature            |
| Snow & Ice                     |  | Glaciers, Ice Sheets and ice shelves, Permafrost, Snow  | Sea Ice  |
| Biosphere                      |  | Land Cover, Leaf Area Index (LAI), Fraction of Absorbed Photosynthetically Active Radiation (FAPAR), Fire | Plankton, Oxygen, Nutrients, Ocean Colour, Marine Habitat Properties                     |
| Human Use of Natural Resources |  | Water Use, Greenhouse Gases (GHG) Fluxes  | Marine Habitat Properties  |

# Climate observations also support

- Energy & Temperature
- Other Physical Properties
- Carbon Cycle and other GHGs
- Hydrosphere
- Snow & Ice
- Biosphere

**Temperature and Energy**

**Atmospheric Composition**

**Ocean and Water**

**Cryosphere**

**Headline Indicators**

**Surface Temperature**

**Atmospheric CO<sub>2</sub>**

**Ocean Acidification**

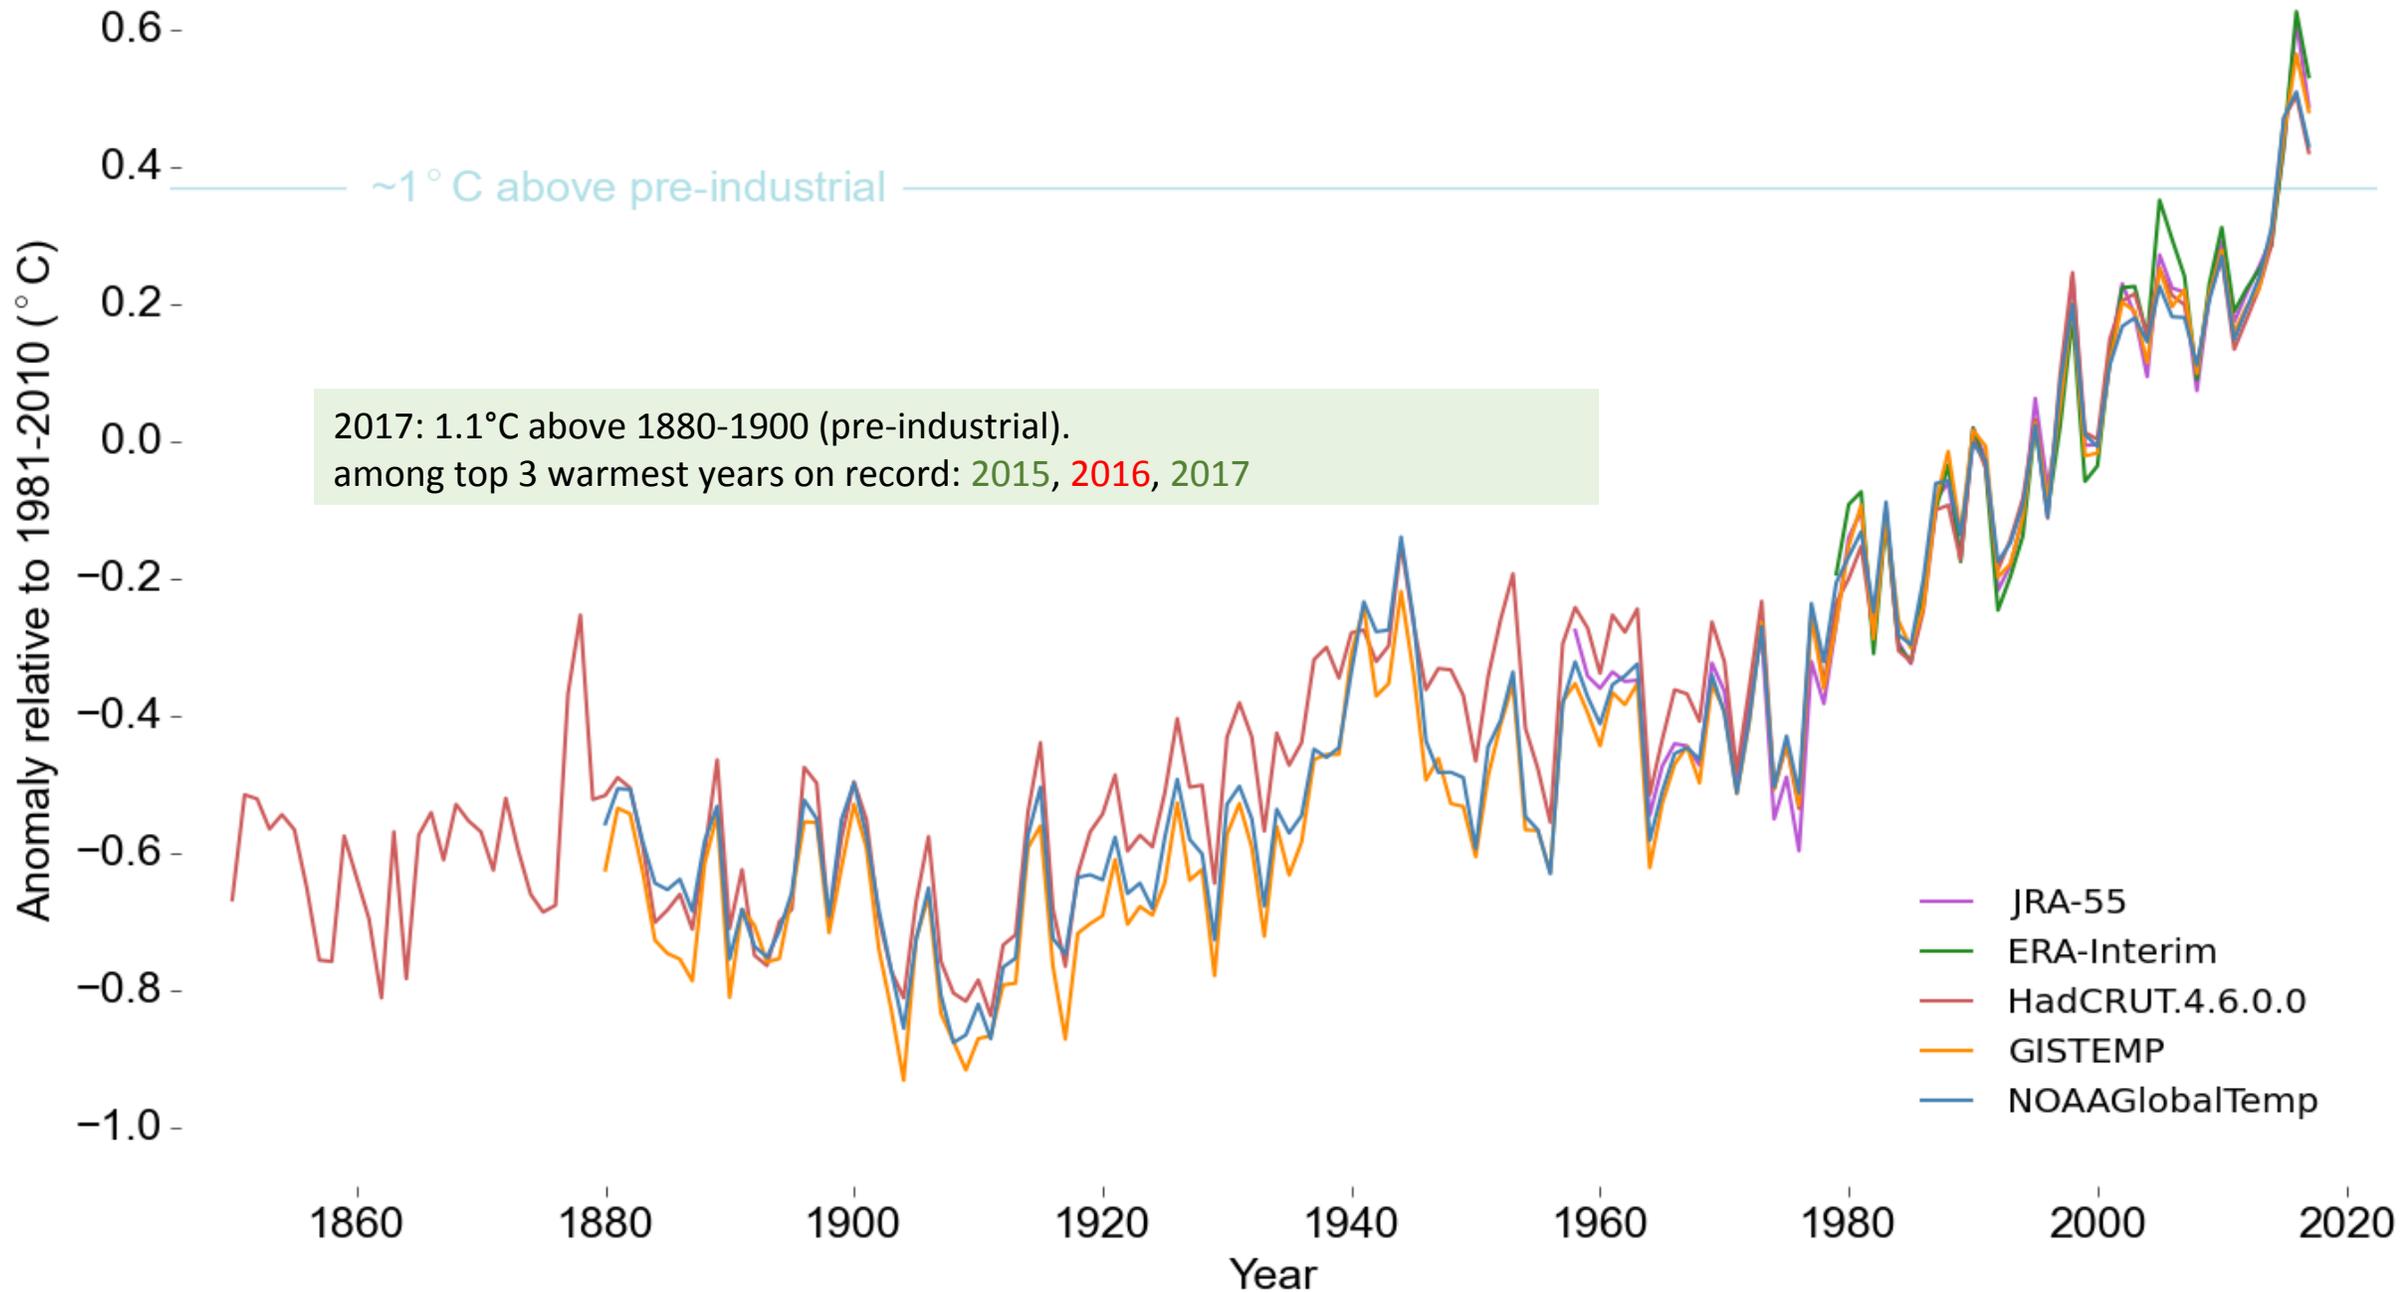

**Glacier Mass Balance**

**Ocean Heat**

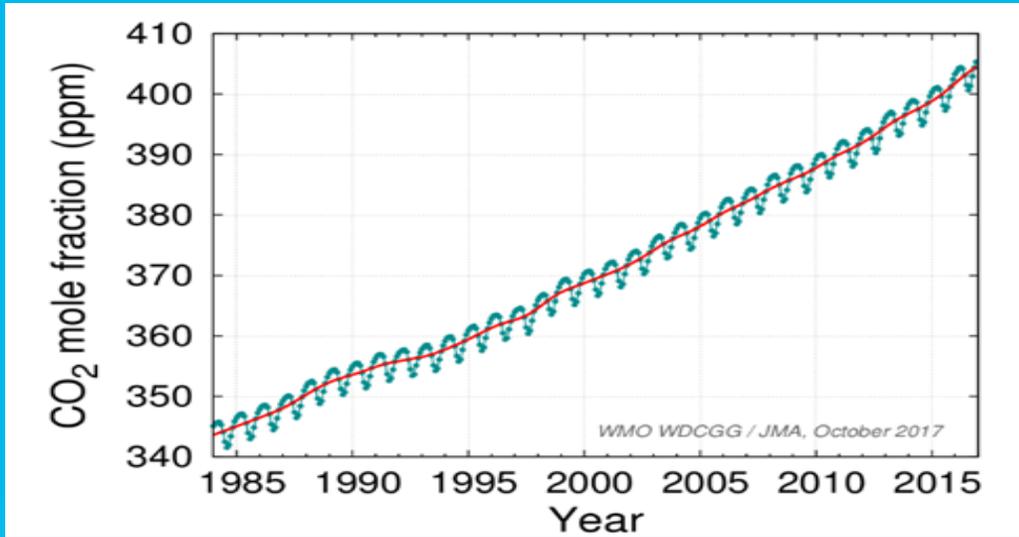

**Sea Level**

**Arctic and Antarctic Sea Ice Extent**

# Global temperature anomaly 1850-2017 relative to 1981-2010

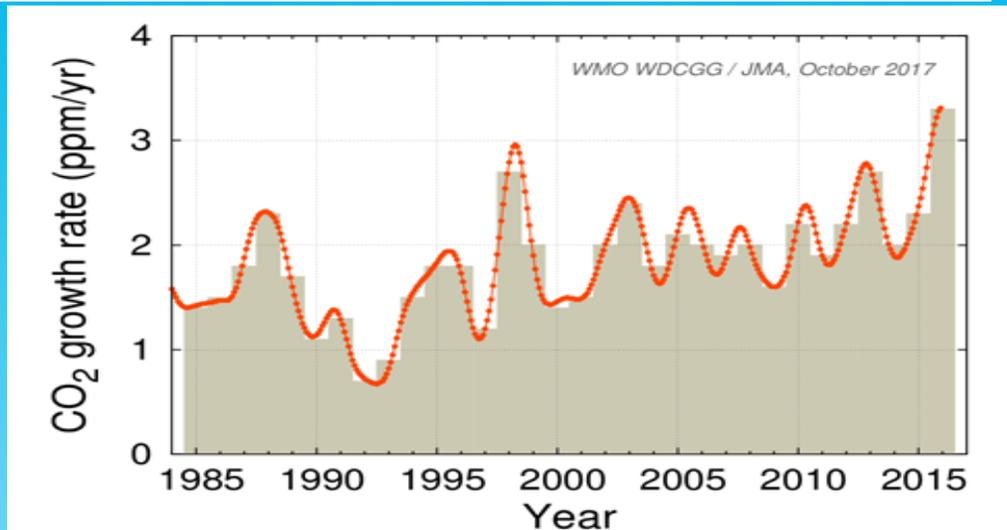

# Greenhouse gas concentrations continue to rise

GHG concentration reached new highs in 2016, with:

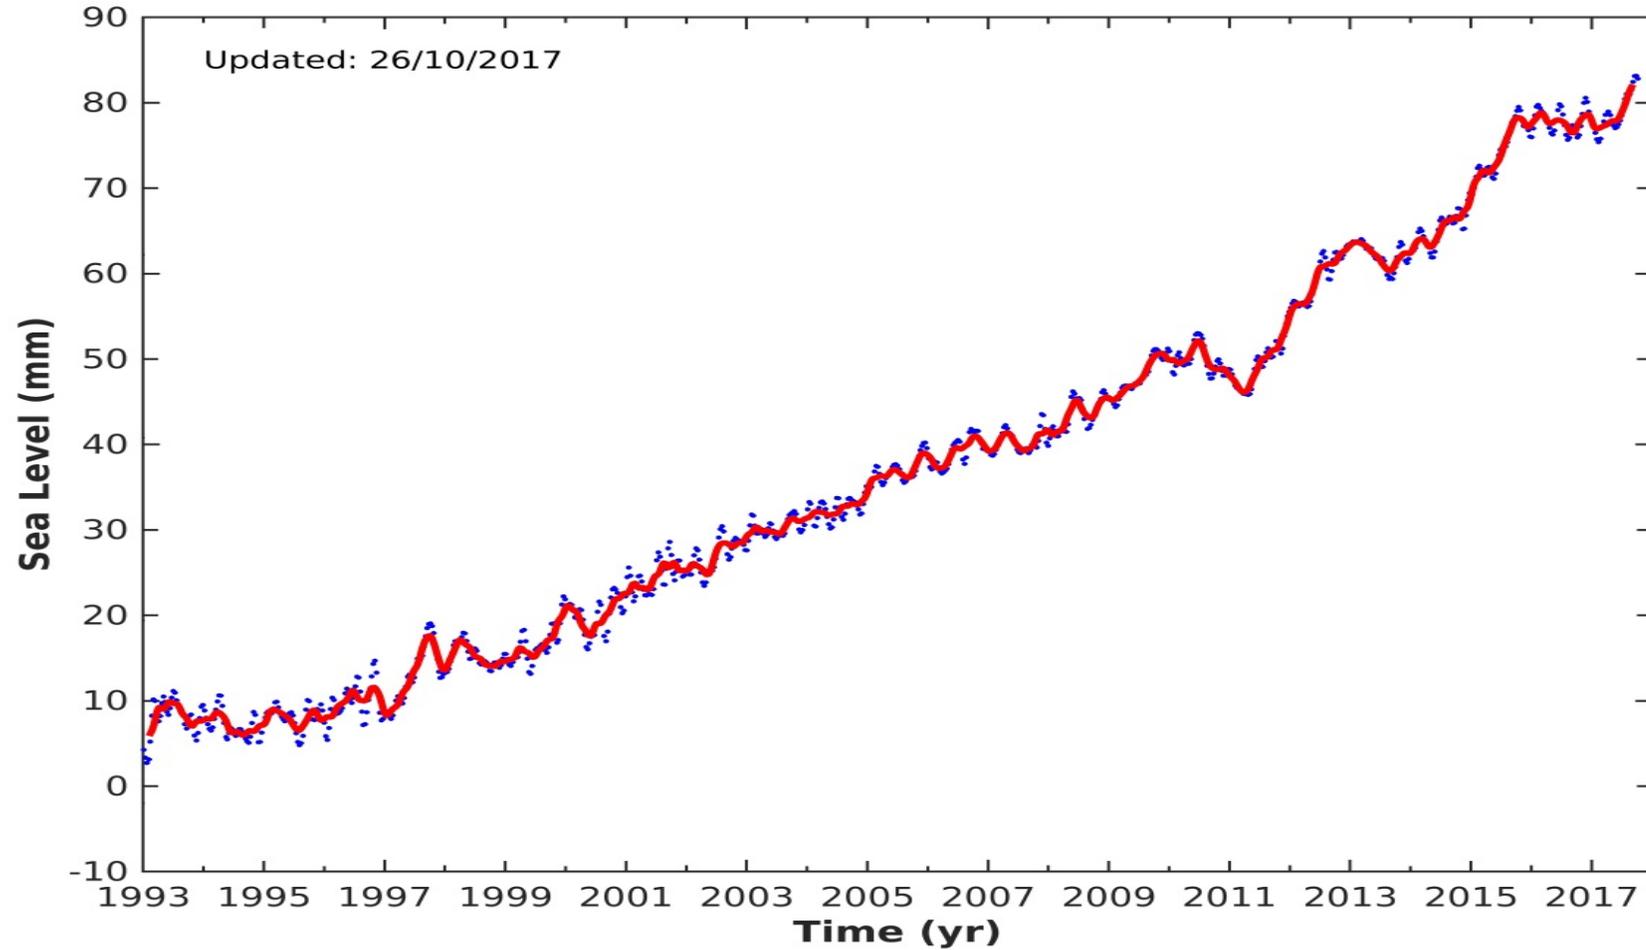

|                              |                              |
|------------------------------|------------------------------|
| CO <sub>2</sub> : 403.3 ppm  | 145 % of preindustrial level |
| CH <sub>4</sub> : 1853 ppb   | 257 %.....                   |
| N <sub>2</sub> O : 328.9 ppb | 122 %.....                   |

The increase in CO<sub>2</sub> from 2015 to 2016 was the largest annual increase observed in the post-1984 period.

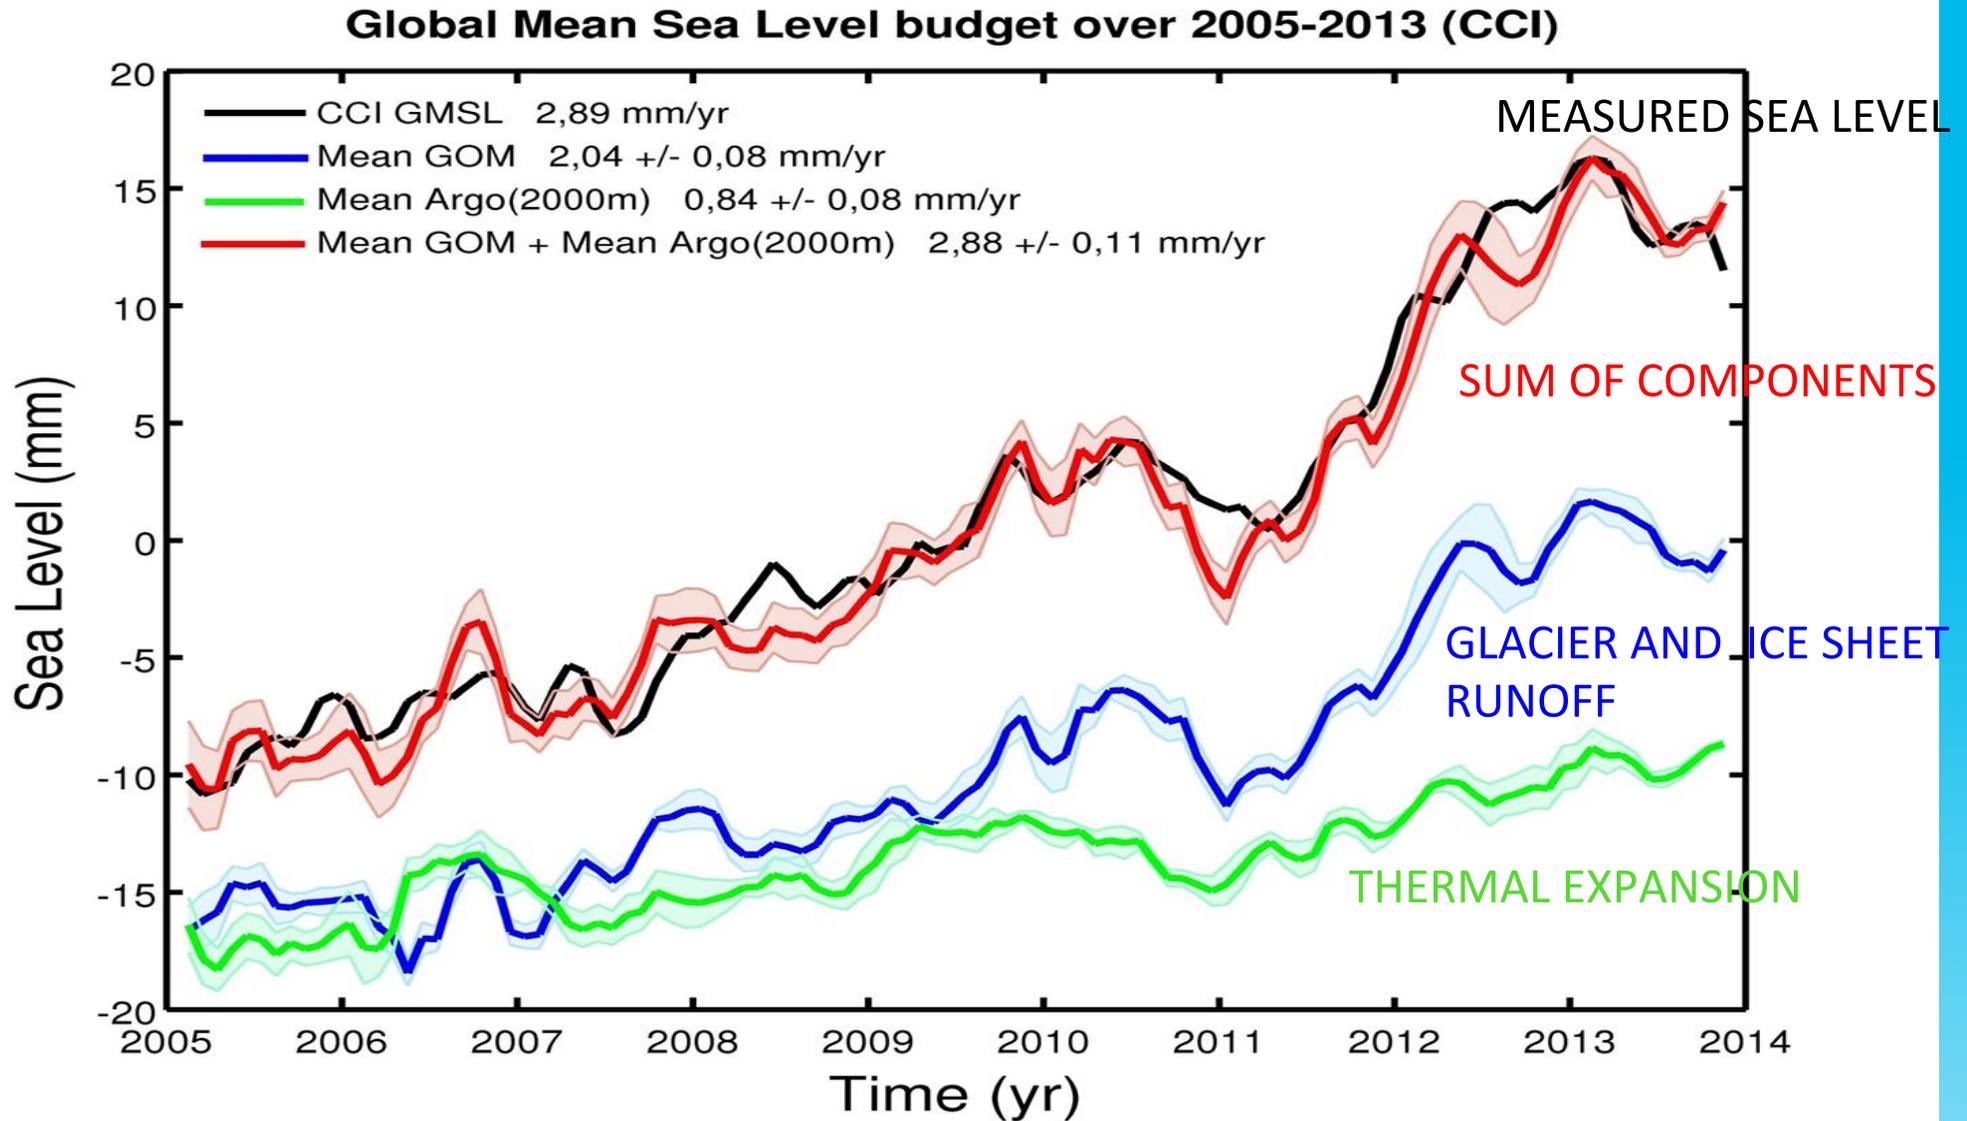

The previous largest annual increase was in 1998, also at the end of a strong El Niño event

Increased likelihood of 2003 heatwave event as function of anthropogenic change (Christidis et al. 2015)

# Return times of summer heatwave with and without anthropogenic forcing

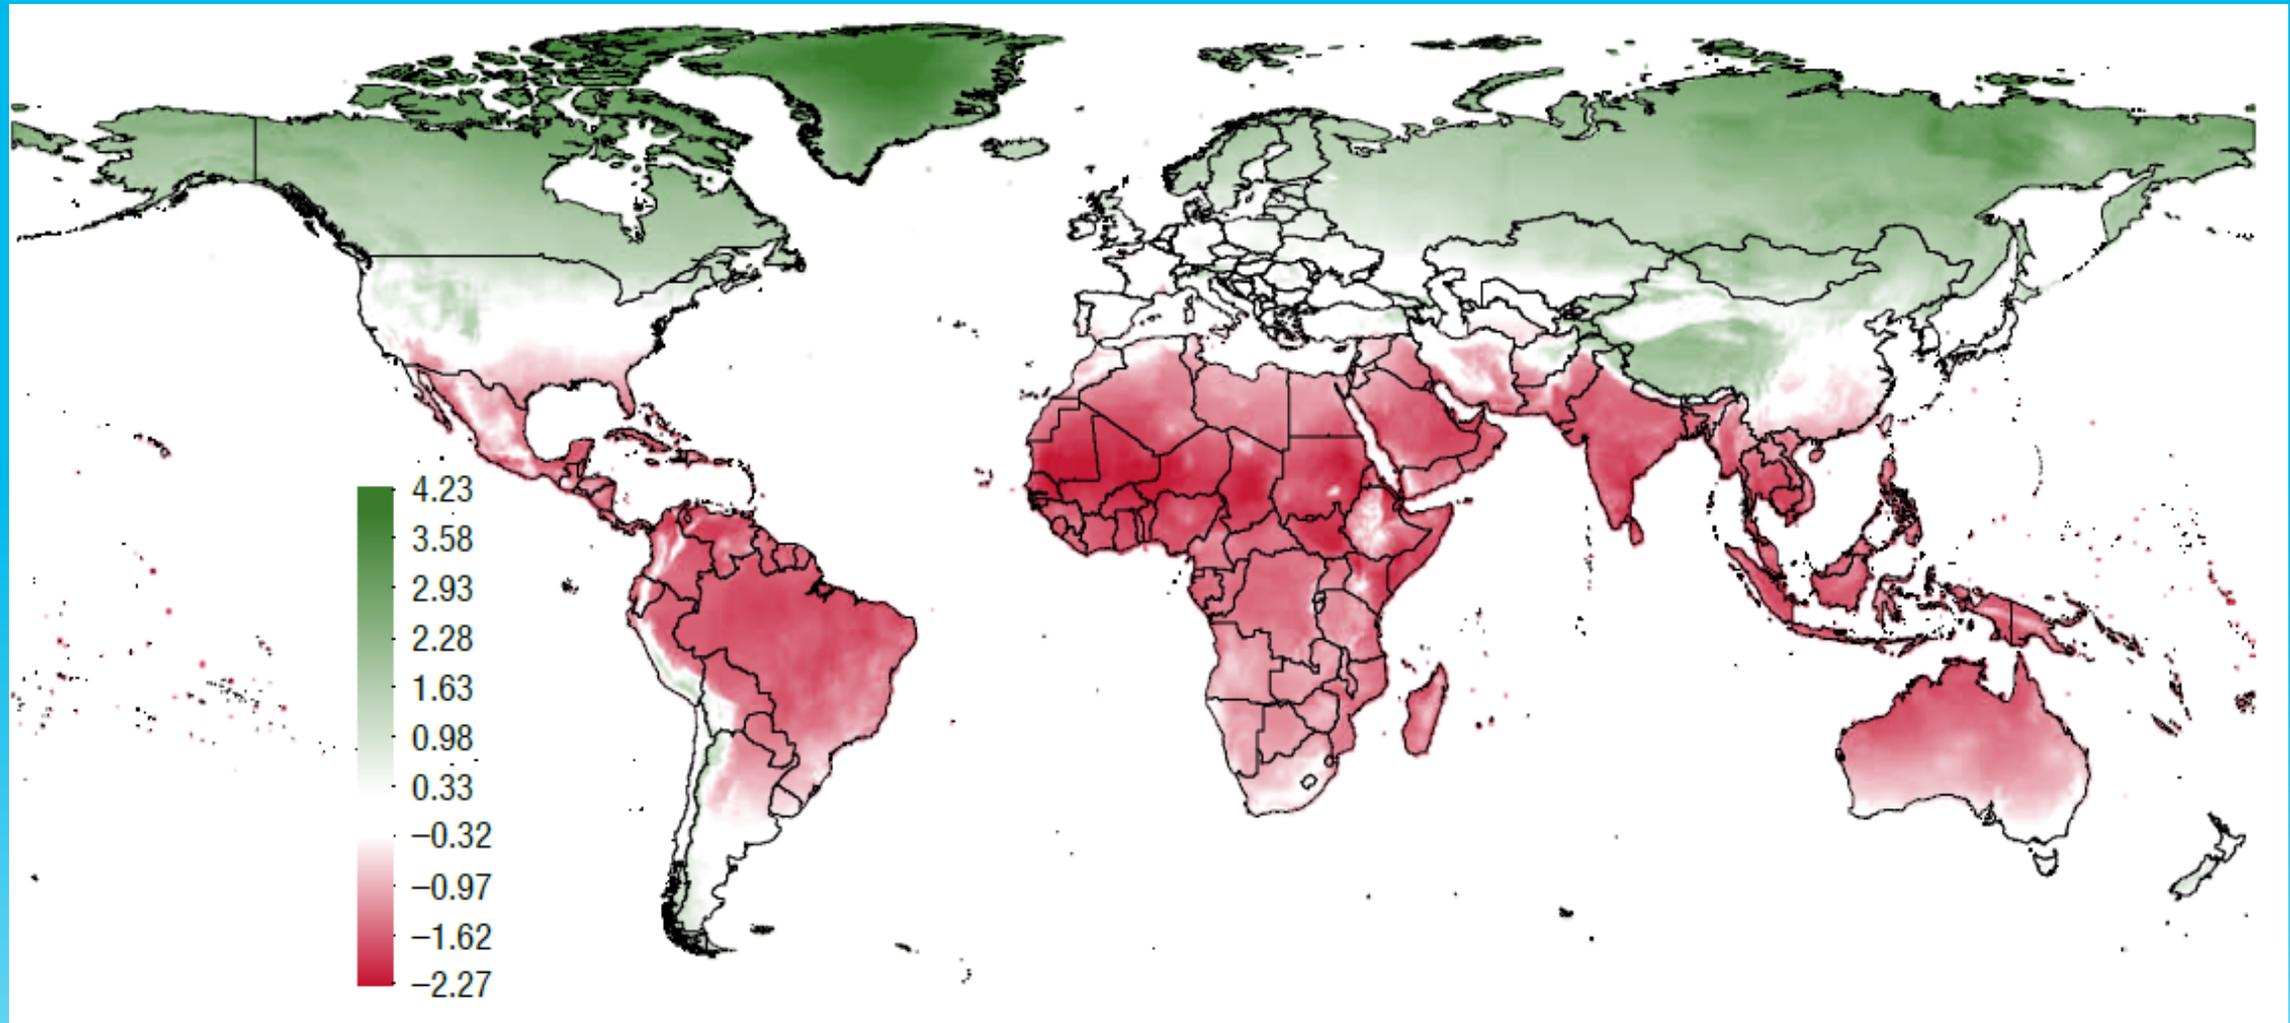

**Table 1 | Return times (RT) of summer heatwave events in the reference region, characterized by temperature anomalies above a given threshold and estimated with and without the effect of human influence on the climate (ALL and NAT).**

|  | Decade 1990-1999 | Decade 2003-2012 |
|--|------------------|------------------|
| Threshold = 1.6 K                      |                  |                  |
| *RT <sub>ALL</sub> (years)             | 52 (14-444)      | 5 (2.7-11)       |
| RT <sub>NAT</sub> (years)              | >10 <sup>4</sup> | >10 <sup>3</sup> |
| PRB <sub>ALL</sub> /PRB <sub>NAT</sub> | >10 <sup>3</sup> | >10 <sup>3</sup> |
| Threshold = 2.3 K                      |                  |                  |
| RT <sub>ALL</sub> (years)              | >10 <sup>3</sup> | 127 (34-999)     |

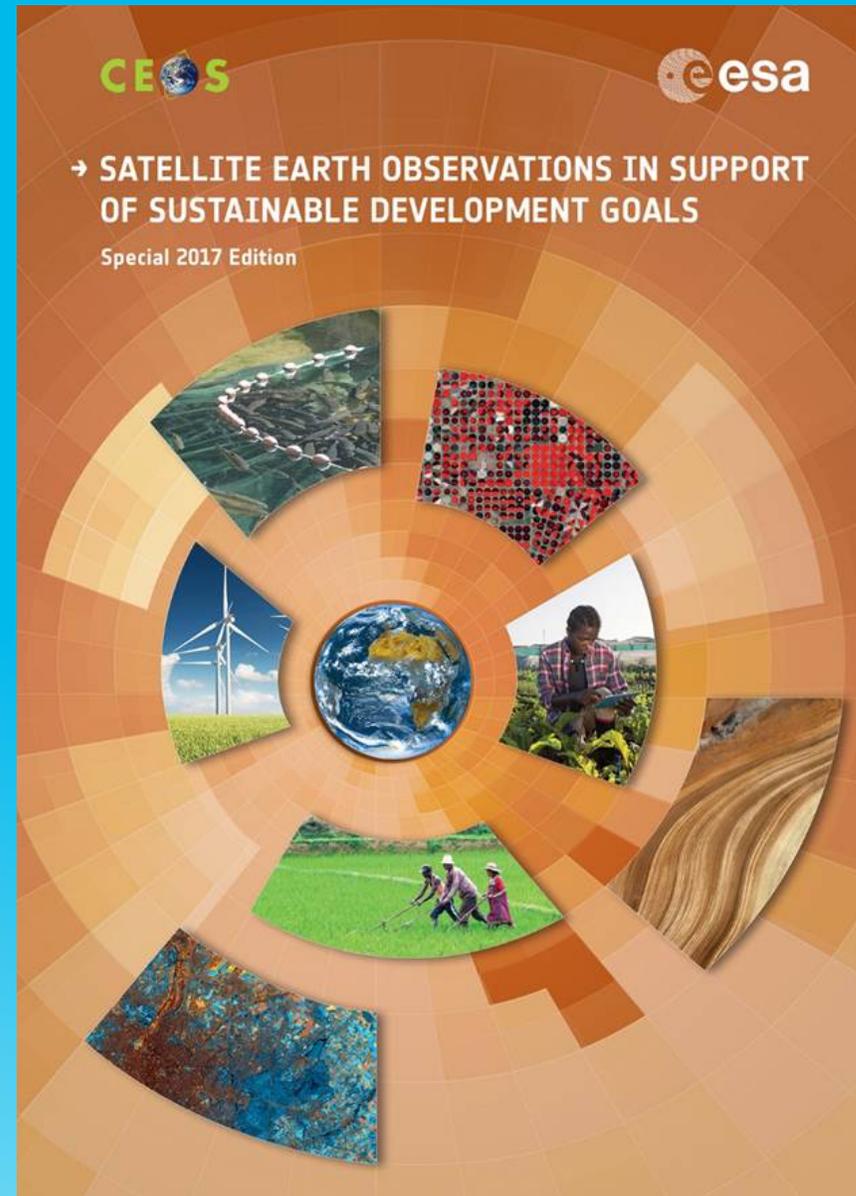

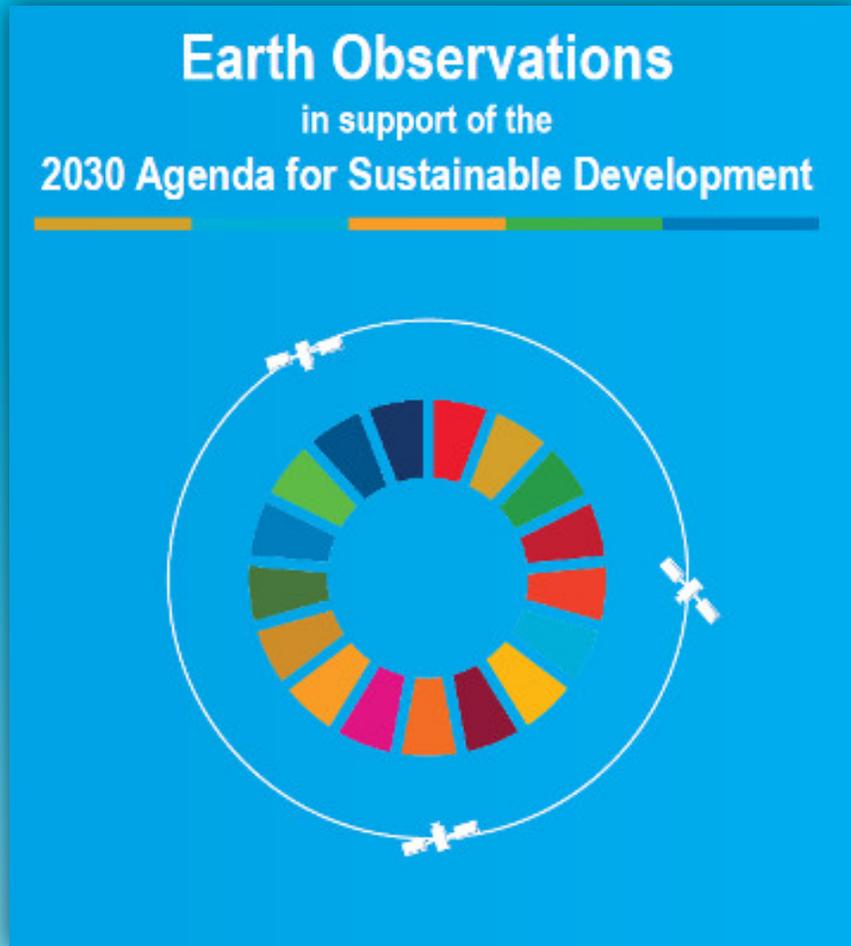

The change in the probability due to anthropogenic forcings (PRB<sub>ALL</sub>/PRB<sub>NAT</sub>) is also shown for the 1.6 K threshold. Estimates in brackets correspond to the 5-95% uncertainty range. For probabilities too small to be accurately estimated, a best approximation of the order of magnitude of the 5th percentile is reported.

\*NB for climate statistics of decade 1900-1910, RT<sub>ALL</sub> >100

Sentinels 1 and 2

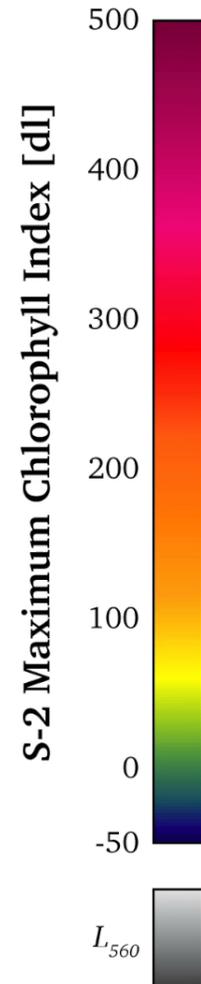

# Monitoring Water Quality in open waters Lake Turkana (Kenya)

2006, MERIS (S3 precursor)

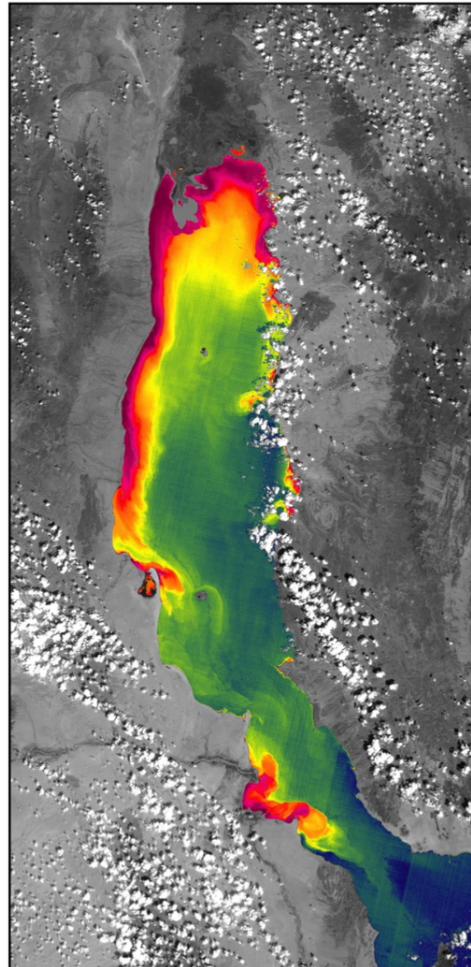

## SPOTLIGHT

“I think Lake Turkana is going to be the second Aral Sea. It is one of the worst environmental disasters you can imagine.”

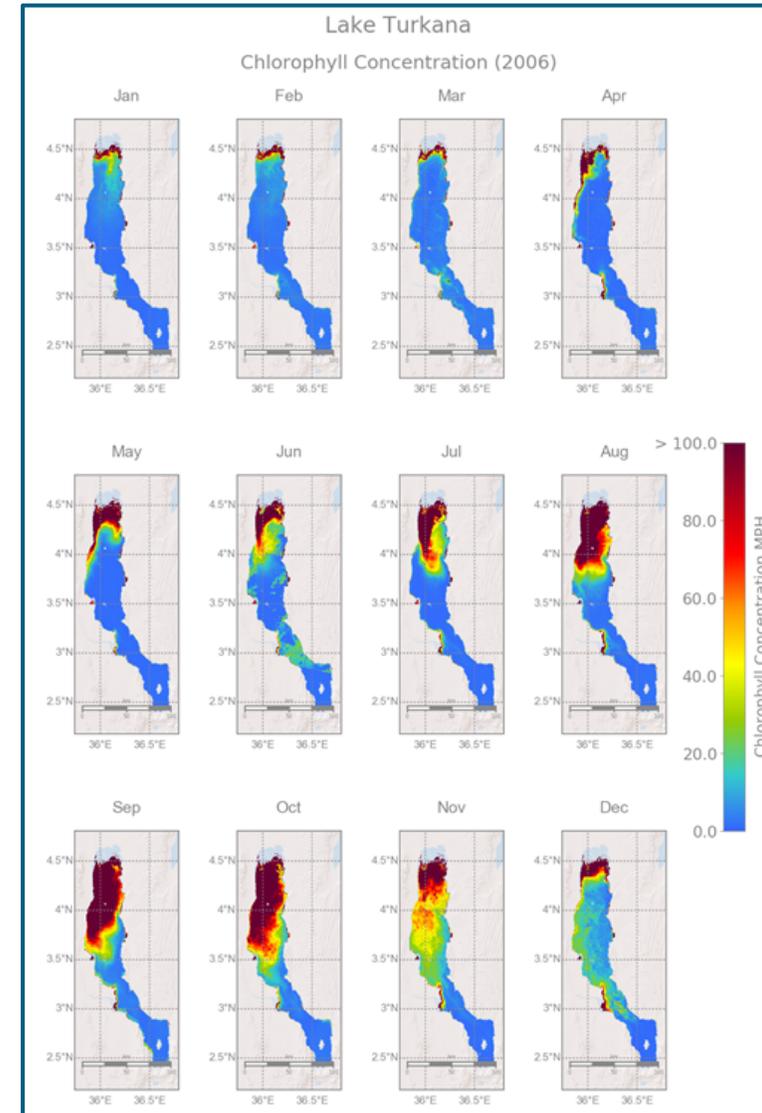

[R. Leakey, Chair of Kenya Wildlife Service]

2015-16, Sentinel 2

— 2015-12-09

# SDG 11

Make cities and human settlements inclusive, safe, resilient and sustainable

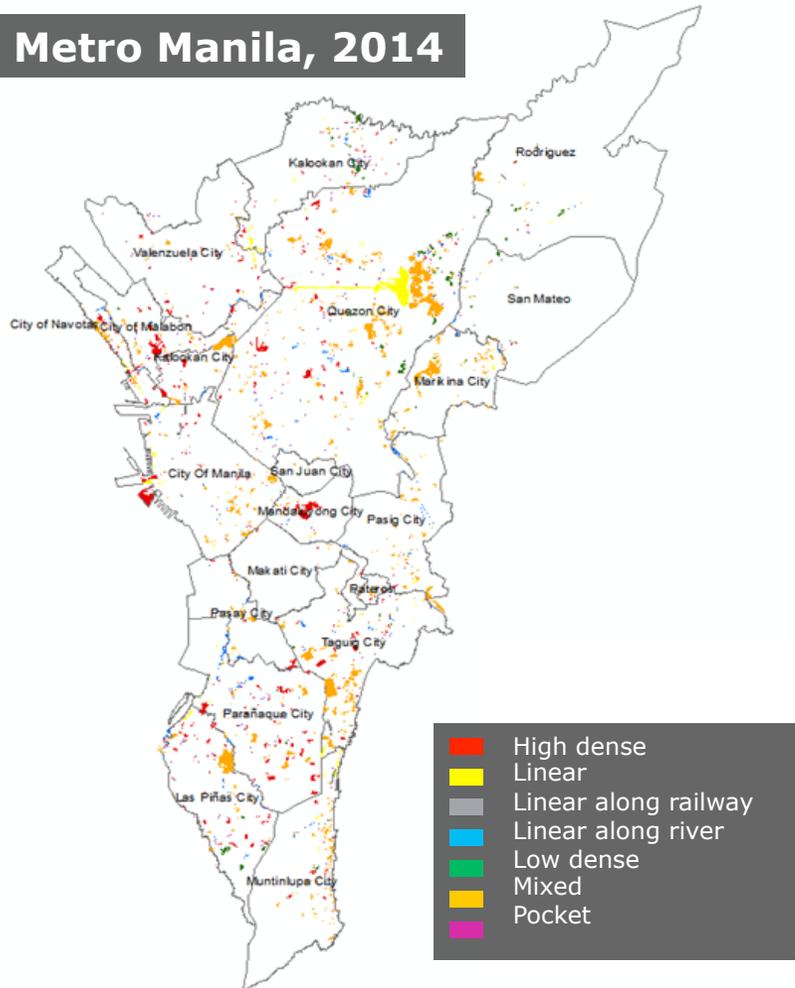

**Target 11.1** By 2030, ensure access for all to adequate, safe and affordable housing and basic services and upgrade slums

**Indicator 11.1.1** *“Proportion of urban population living in slums, informal settlements or inadequate housing”*

- Population Distribution and Density
- Extent and Type of Informal Settlement**

**Metro Manila, 2014**

Extracted from very high resolution imagery. Often using advanced semi-automated Object-Based Image Analysis (OBIA) techniques.

Analysis and classification based on attributes reveals typology.

Data: Pléiades 1A.  
Processing: GIM.

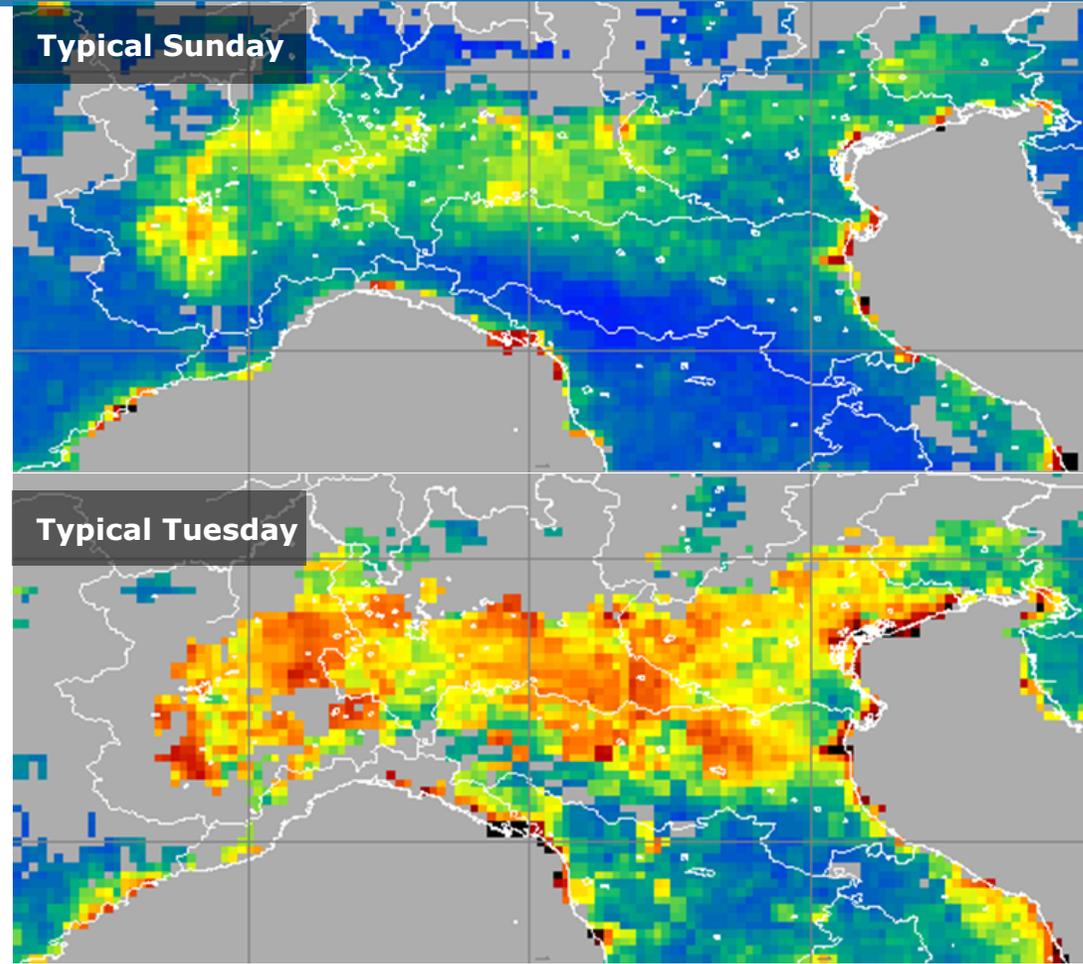

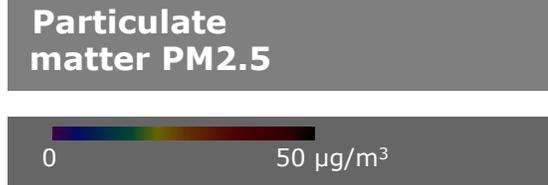

Detecting and characterising Informal Settlements using very high resolution imagery

**Target 11.6** By 2030, reduce the adverse per capita environmental impact of cities, including by paying special attention to air quality and municipal and other waste management

**Indicator 11.6.2** “Annual mean levels of fine particulate matter (e.g. PM2.5 and PM10) in cities (population weighted)”

**EO-derived parameters**

- Annual mean levels of coarse particulate matter (PM10)
- Annual mean levels of fine particulate matter (PM2.5)

Aerosol thickness, e.g. optical depth of PM10 and PM2.5 (an indicator of the overall pollution).

Typical spatial resolutions: 1–10 km on a daily basis, with local improvements down to street level when adequate in-situ information and/or modelling is available

Data: MODIS/Aqua.  
Processing: Carlo Gavazzi Space / ISAC-CNR.

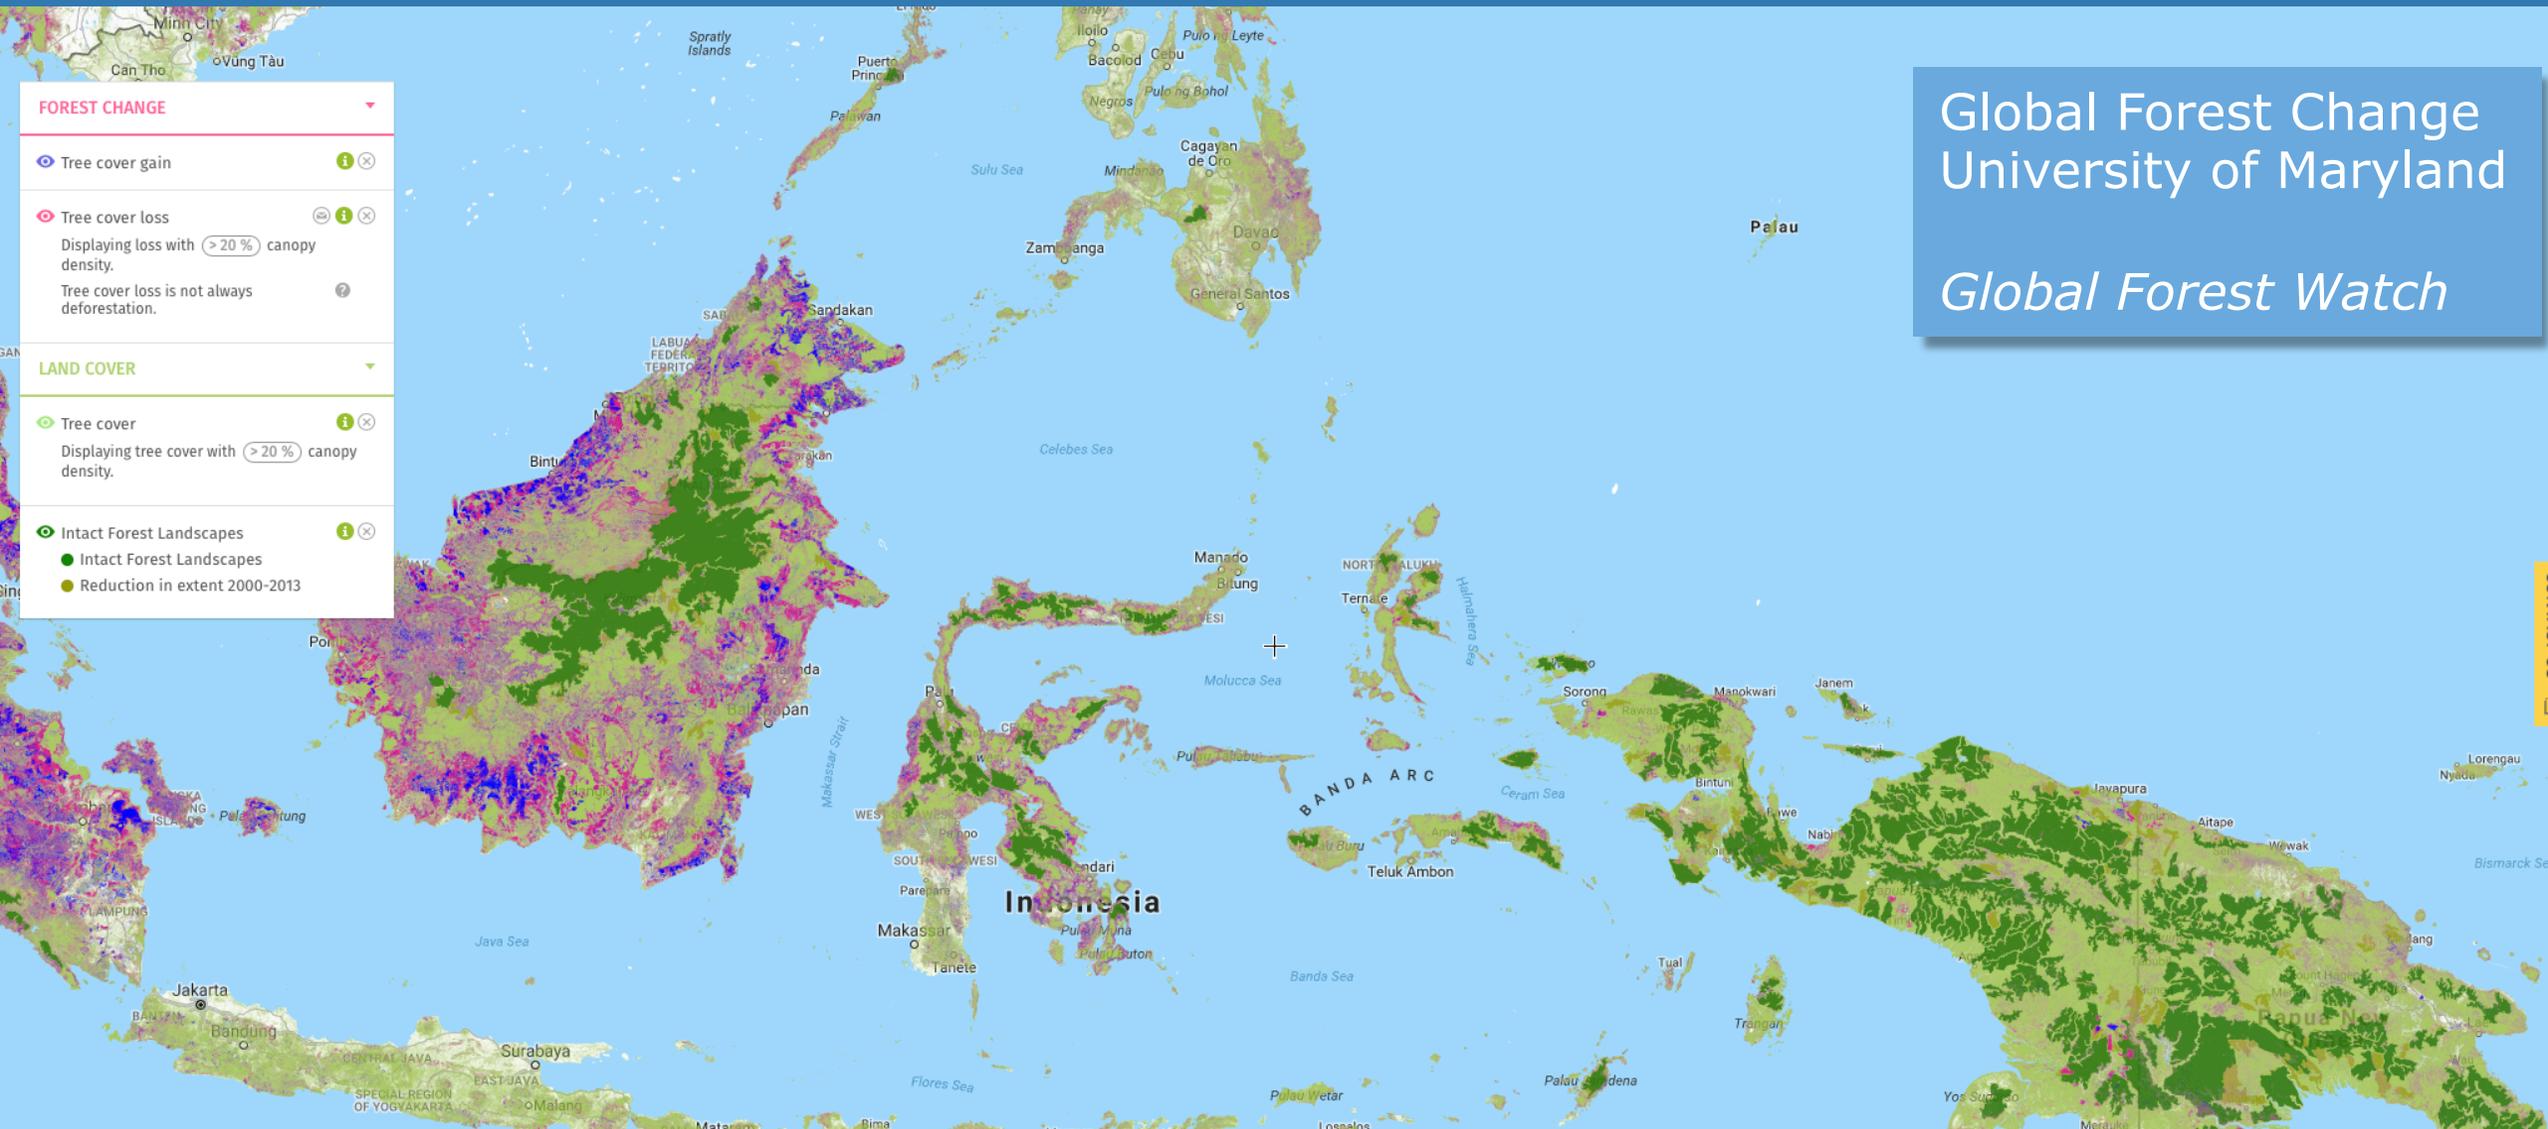

Fine particulate matter concentrations (2.5 and 10) over cities are estimated through numerical modelling, integrating satellite data (LEO/GEO through AOT assimilation) and in-situ data

# SDG 15

Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse

**Target 15.1** By 2020, ensure the conservation, restoration and sustainable use of terrestrial and inland freshwater ecosystems and their services, in particular forests, wetlands, mountains and drylands, in line with obligations under international agreements .

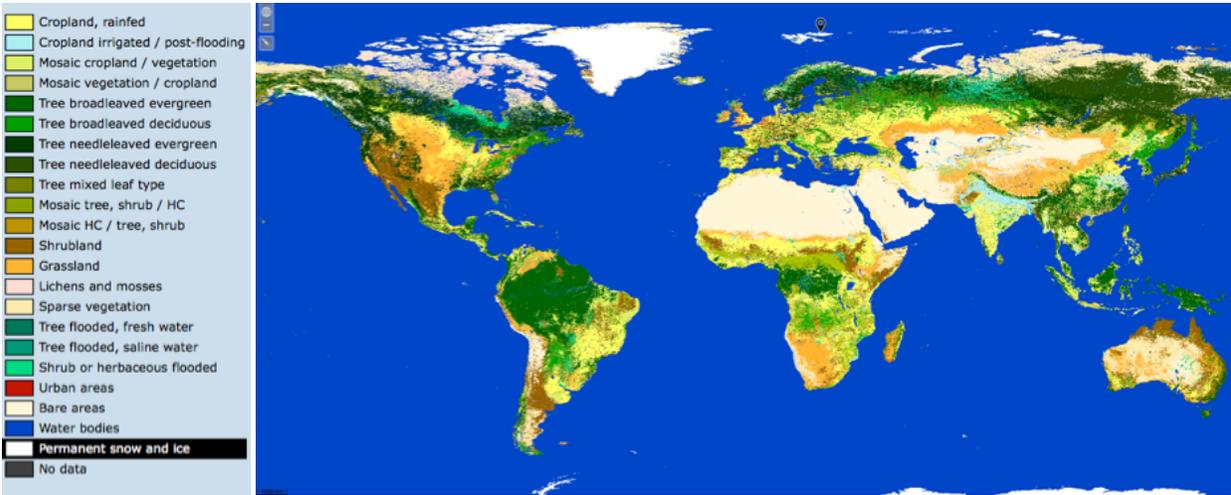

**Indicator 15.1.1 "Forest area as a proportion of total land area"**

Global Forest Change  
University of Maryland  
*Global Forest Watch*

**Target 15.3** By 2030, combat desertification, restore degraded land, including land affected by desertification, drought and floods, and strive to achieve a land degradation-neutral world.

**Indicator 15.3.1 "Percentage of land that is degraded over total land area"**

**Land Cover**

GLOBAL LAND COVER MAP,  
1992-2015 Annual maps

AVHRR SPOT VGT, MERIS,  
PROBA-V, S3300m

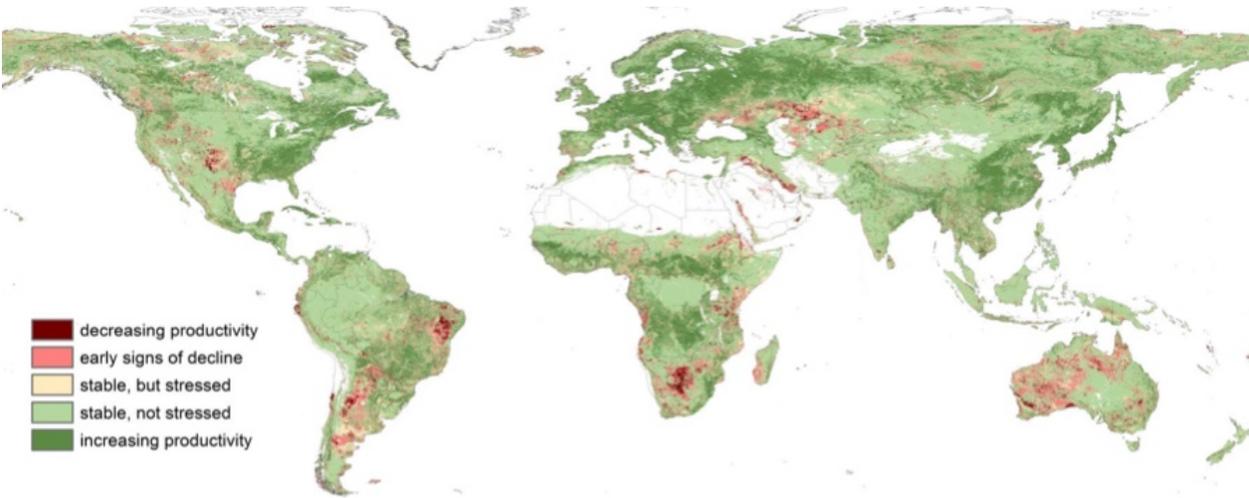

**ESA Land Cover CCI**

**Custodian Agency:**

- UNCCD (secretariat and Global Mechanism)

**Other Involved Agencies**

- FAO, UNEP/WCMC, CBD, UNFCCC

**Land Productivity Dynamics**

LPD derived from 1999-2013 NDVI  
phenological analyses

SPOT VEGETATION, 1km

**EC Joint Research Center (JRC)**

**TIER III**

Monitoring 15.3.1. on the status & trends in land degradation is based on sub-indicators:

- (1) **Land Cover and Land Cover Changes** (2) **Land Productivity** (3) **Soil Organic Carbon**
