Research on One Satellite Flight Control Simulation and Support System

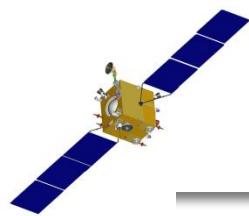

2011-8

1 Introduction

- ◆ The characteristics of the satellite
- ◆ The characteristics and effects of the system of flight control support and simulation of the satellite

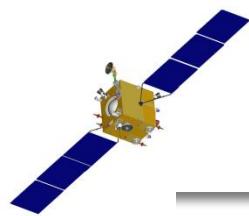

2 Major functions

- ◆ Preparation stage before the mission
- ◆ Before the major events during mission implementation
- ◆ After the major events during mission implementation
- ◆ 1: 1 Simulation flight

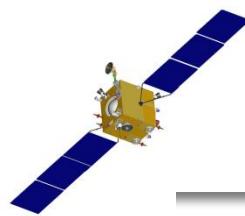

3 System configuration and working principle

The system of flight control support and simulation consists of three sub-systems:

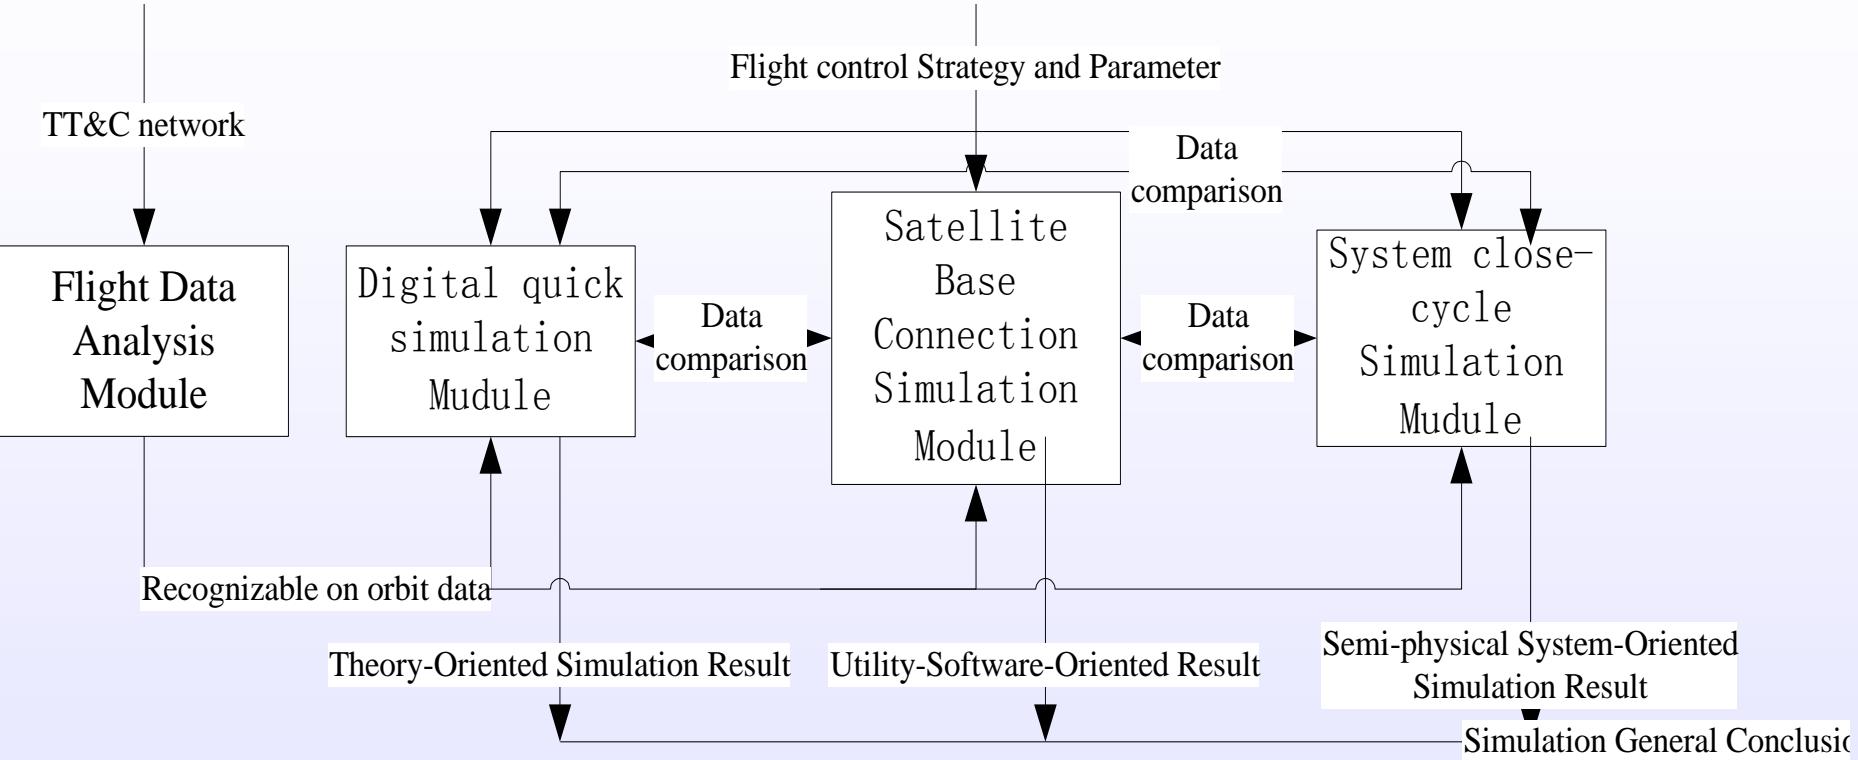

- ◆ **Sub-system of digital quick simulation**
- ◆ **Sub-system of closed-cycle simulation**
- ◆ **Sub-system of satellite and base connection simulation**

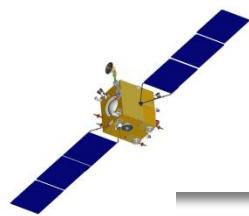

They form an interdependent organism but at the same time each one is a comparatively independent small system, and synchronizes with the satellite through TT&C network.

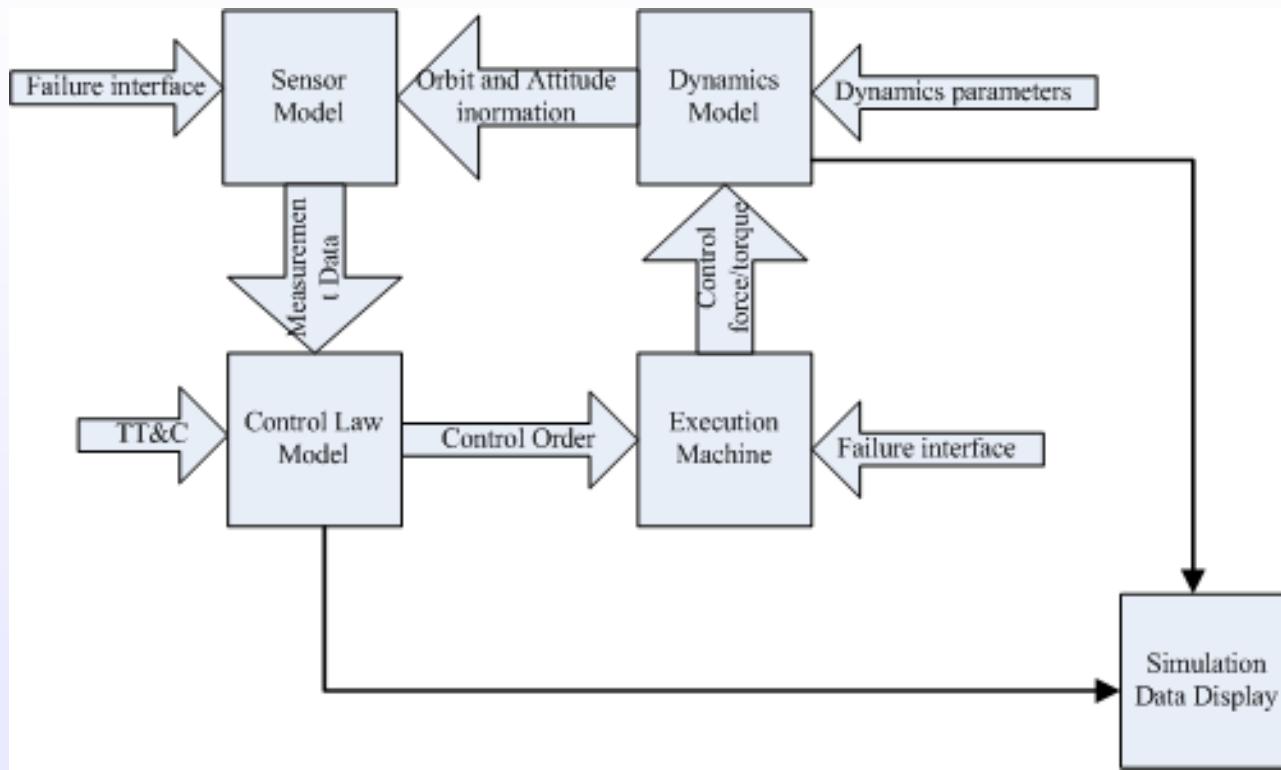

3 System configuration and working principle

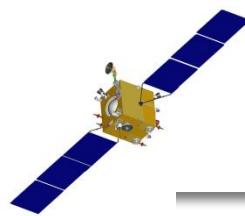

3 System configuration and working principle

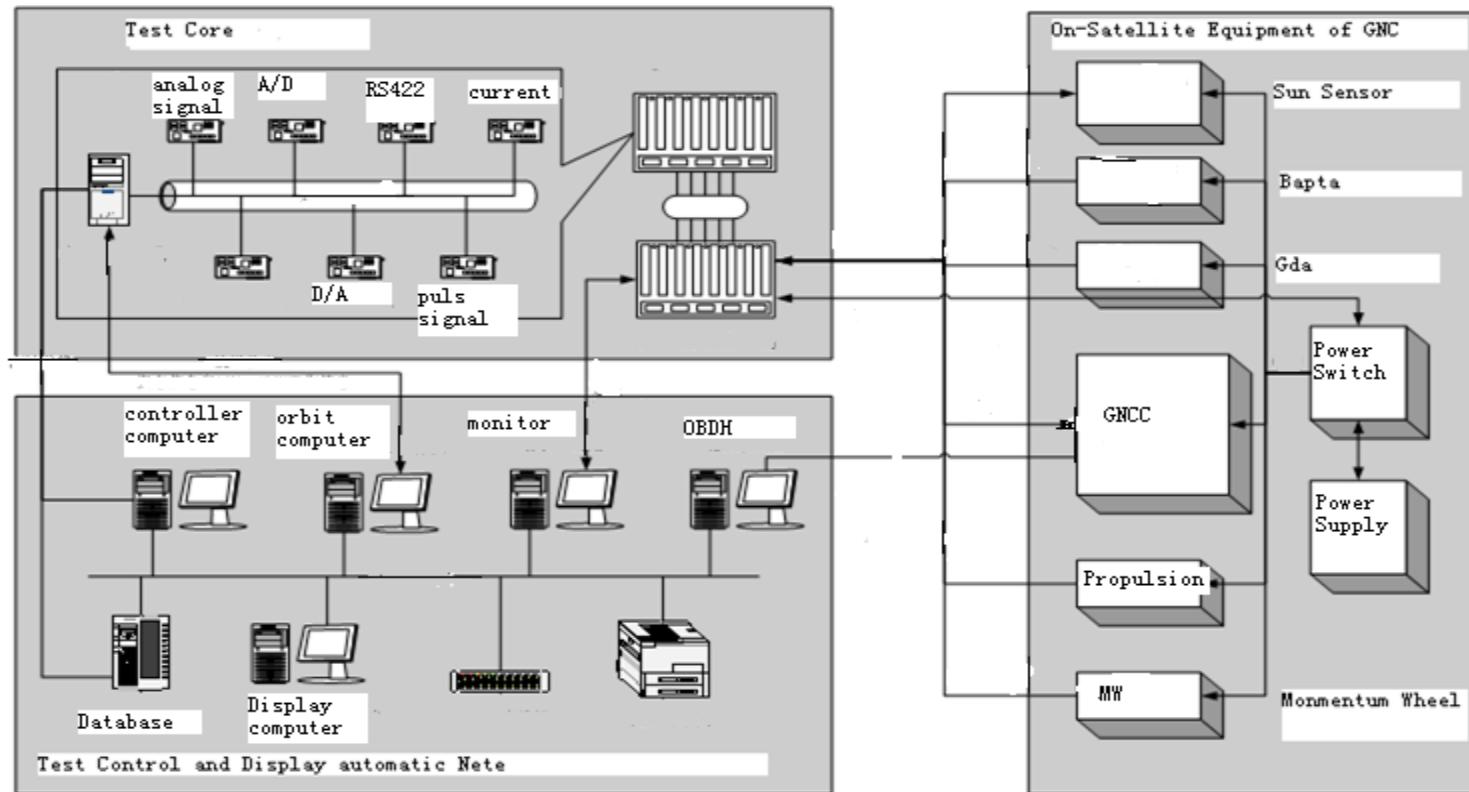

➤ Sub-system of digital quick simulation

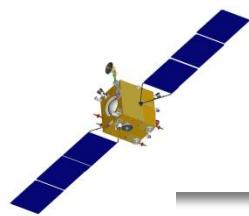

3 System configuration and working principle

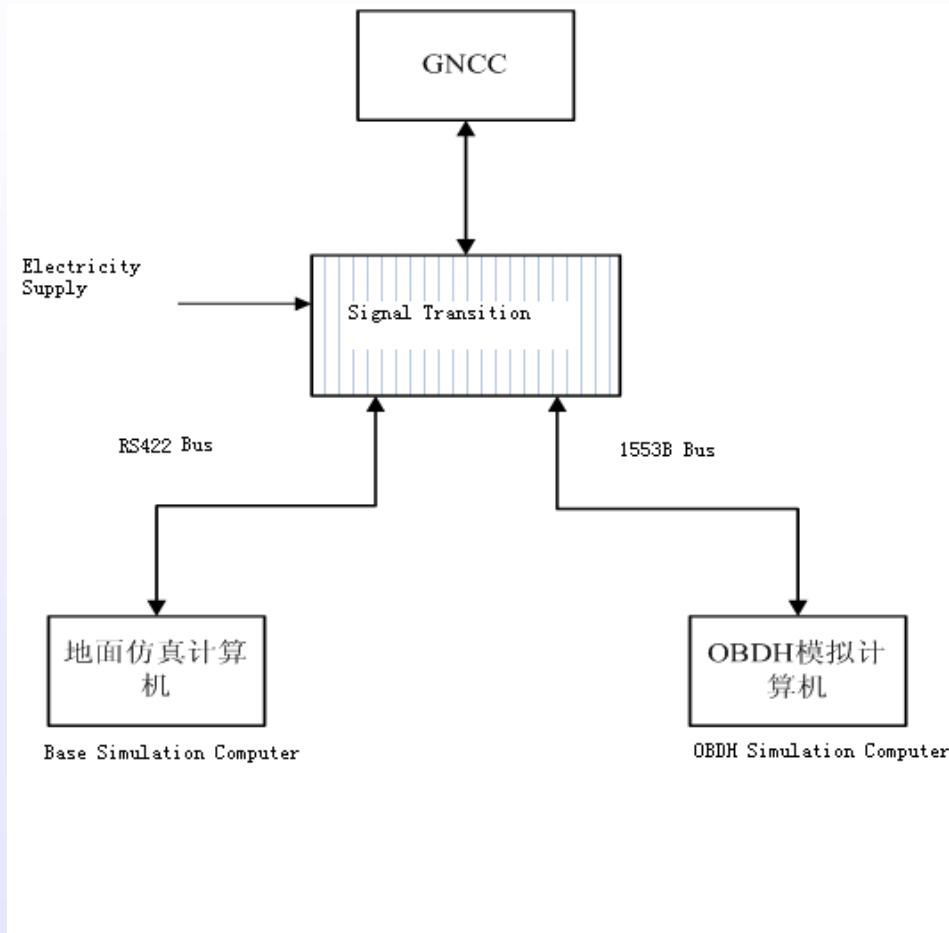

➤ Sub-system of Closed-cycle Simulation Test

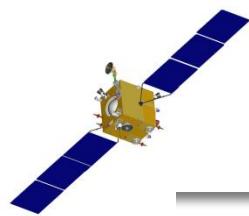

3 System configuration and working principle

➤ Sub-system of Satellite and Base Connection Simulation

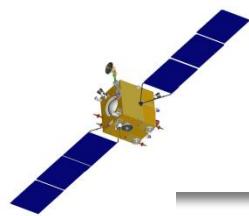

4 Aspects of Technology Improvement

- ◆ The general frame and design idea of the practical and multi-function system of satellite flight control support and simulation
- ◆ Test equipment with high quality
- ◆ Simulation technique of the combination of normal mode and failure mode
- ◆ Strong real time and highly dependable flight control support technique aiming at deep space exploration

5 Application Result

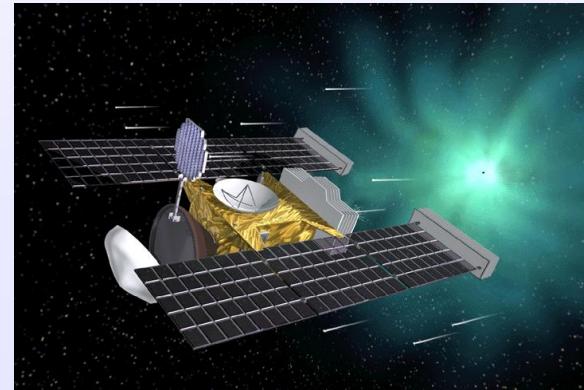

- ◆ **Advance verification of flight control events**
- ◆ **Checking of orbit control strategy**
- ◆ **Test of flight control implementation order and parameter**
- ◆ **Management and analysis of flight remote test data**
- ◆ **Base test of flight parameter at stage of on-orbit test**

6 Conclusion

Conclusion and Prospect

Thanks !
